Farlow Herbarium of Harvard University

Index to the Moss Herbarium of Thomas Taylor

The Taylor cryptogamic herbarium, containing mosses, hepatics and lichens, was presented to Harvard by John Amory Lowell, who purchased it on the advice of Asa Gray in 1849. The moss section, here indexed, contains 4036 specimens. Taylor was born, probably in the 1780's though the date is uncertain, in the "East Indies," where his father was Colonel in the East Indian Army. He attended Trinity College, Dublin, taking the B.A. in 1807 and the M.D. in 1813/14. After practicing medicine in Dublin for about ten years, he removed to Cork, and was Professor of Natural History at the short-lived Royal Institution of that city. Before 1832 he retired to the village of Dunkerron, near Kenmare, in County Kerry, where he died in February 1848.

Taylor collaborated with W. J. Hooker on the first (1 January 1818) and second (early 1827) editions of Muscologia Britannica. Other major publications were on collections of William Jameson from Ecuador and James Drummond from Australia. The herbarium has specimens, including isotypes, of Taylor's friends and correspondents, particularly the Hookers, William Wilson, Dawson Turner, and Archibald Menzies. There are smaller but valuable groups of specimens, acquired at first or second hand, such as the 41 from the Hedwig-Schwaegrichen herbarium, and some from the herbaria of Dillenius, Palisot de Beauvois, and Dickson. Although it was the hepatics and lichens of

J. D. Hooker's Antarctic Expedition on which Taylor published, nevertheless the moss specimens in this herbarium, over 250, are probably the largest set outside Britain. These have been freely annotated by Sullivant, to whom the herbarium was loaned soon after it came to Harvard, and who kept it until his death.

The specimens are generally small, but usually accompanied by notes and sketches. The proportion of types is remarkably large, including 120 holotypes of Taylor's published names. We have underlined types on the index, but only in the case of Taylor's have we made the bibliographic confirmations or distinguished holotypes from others. We have also underlined the large number, some 240, of Taylor's manuscript names, which are indicated as "Tayl. ms." From Taylor's time to the present, his herbarium names have been picked up occasionally, either by validation or in synonymy, by Hooker, Wilson, Mitten, Spruce, Brothrus, Hartmann, Dixon, W. Meijer, and probably others we have not noted. As is the practice with the reference herbaria at the Farlow, names in the original herbarium have not been altered to correspond with current nomenclature, which may be found in Index Muscorum.

Alphabetical Listing of Genera Represented in the Taylor Herbarium

	Sheet Numbers	Number of Specimens
Acidodontium	1-3	2
Acroschisma	4	2
Anacalypta	5	1
Andreaea	6-20	9
Anictangium	21-31	22
Anomodon	32-35	11
Archidium	36	1
Aulacomnium	37-41	12
Barbula	42-55	33
Bartramia	56-97	104
Bartramidula	98	4
Brachymenium	99-116	29
